## General description

The machine has a cast iron slanting machine bed.

The max capacity of the spindle for bars is 42 mm with the C42 and 65 mm with the C65.

- 1 Main switch
- 2 EMERGENCY STOP button
- 3 Operating pane

The machine can be equipped with up to 3 turrets that can have X-, Z-, Y- axes and a B-correction axis ( $\pm 1$  degree).

The optional Y-axis has a total travel of 70 mm (+40/-30).

The B-axis is a correction axis that can be swiveled within a range of  $\pm 1$  degree. It serves, for instance, for the correction of the tool position. It exists too on machines without a Y-axis.

**With the cycle L100 (basic program position) the B-axes are automatically positioned to 0°.**

For travels refer to the "Working Area Drawings" in the chapter "Technical data".

## Guiding plate system

The guiding plate system of the tool carriers slides directly on the machine bed driven by a struts system.

- 4 ceramic coated steel strips
- 5 hardened cast iron plate

Fig.: Guiding plate system tool carrier 1

P1201.10021\_5

## Counter spindle

There is the choice between a design with a Z-axis or X- and Z-axes.

When the counter spindle is equipped with X- and Z-axes there are the following additional functions available:

- **Polygon turning**  
In this case the hob is mounted directly on the face of the clamping means receptacle.
- **Simultaneous rear end machining**  
By a coupling with the turret 7 (superimposed axis coupling) the counter spindle follows automatically the turret movements and thus enables a simultaneous rear end machining.

The Z- and X-axes of the counter spindle run easily and play free on linear antifriction guides.

The axis drive consists of a ball screw drive, a motor, a belt drive and a safety brake.

Hob

## Unit Construction System INDEX C42/C65

P1201.10021\_4

- 1 Main spindle
- 2 Machine base
- 3 Tool carrier 1 XZY<sup>1)</sup> with turret 1
- 4 Counter spindle with Z-axis
- 5 Counter spindle with XZ-axes
- 6 Tool carrier 2 with XZY<sup>1)</sup> with turret 2
- 7 Tool carrier 2 with XZY<sup>1)</sup> with turrets 2 and 7

<sup>1)</sup> Y-axis is an OPTION

## Machine bed

The machine bed is made of cast iron and guarantees a high dynamic rigidity and excellent vibrations dampening

## Main spindle

The main spindle is a motorized spindle in synchronized technique driven by an AC-motor. It is supported play free in a thermo-symmetrical headstock.

The main spindle can be equipped with a C-axis.

## Counter spindle

The counter spindle is a motorized spindle in synchronized technique driven by an AC-motor. It is supported play free in a thermo symmetrical headstock.

The counter spindle can be equipped with a C-axis.

The counter spindle is available in two versions:

1. With a Z-axis (longitudinal axis)

2. With a Z-axis (longitudinal axis) and an X-axis (transverse axis)

## Material clamping

Workpieces and stock bars are clamped in a collet or a chuck respectively, that is mounted on the spindle head of the particular spindle.

The clamping is actuated by a hydraulic clamping cylinder.

For further information refer to the chapter "Technical data – spindle head dimensions and dimension sheets for the clamping means".

## Tool carriers

The machine can be equipped with the following tool carriers:

Tool carrier 1 with X-, Z-,Y<sup>1)</sup>-axes and one turret

Tool carrier 2 with X-, Z-,Y<sup>1)</sup>-axes and one turret

or

Tool carrier 2 with X-, Z-,Y<sup>1)</sup>-axes and two turrets

The Y-axis is a linear axis.

Applications: e.g. drilling off center holes, milling of surfaces etc.

## Drive motor – Tool carrier 2 with two turrets

For the drive of the tools and the indexing the turret the tool carrier 2 with two turrets has a common drive motor "S2".

***The functions "Indexing the turrets 2 and 7" and "Tool drive turrets 2 and 7" cannot be executed separately.***

Driven tools are possible in each station of the turrets 2 and 7. Only the tool in working position is rotating.

A drive of its own is available as an option in turret 7 (tool drive and turret indexing). This drive is designated as "S7".

<sup>1)</sup> Y-axis is an OPTION

## Turret

The machine can have up to three turrets(1, 2 and 7) with 12 tool stations each. When there is a driving attachment present each station can be equipped with a driven tool.

P1201.10021\_6

- 1 Turret 1
- 2 Turret 2
- 3 Turret 7<sup>1)</sup>

## Tooling system used

Cylindrical shank to DIN 69880 – 25 Dia

1) This third turret is defined as turret 7 for reason of the programming technique. An indexing to station 5 is programmed as follows: T7 = 5.  
The turret 7 is often called turret 3 in prospectus and plans.

## Definition of the tool geometry

The tools reference point "T" is shifted by D-corrections referred to the tool tip "P".

**Turret 1**

**Turret 2**

**Turret 7**

P1201.10021\_13

## Tool carrier 8 - Counter spindle

When the counter spindle is used as a tool carrier then it is designated as **tool carrier 8**

P1201.10021\_27

---

## Assignment of the D-corrections

There are max. 200 correction numbers available. They can be assigned arbitrarily (D1 – D996).

The following assignment is recommended.

### Turrets

| Turret | D-numbers     |
|--------|---------------|
| 1      | D100 ... D199 |
| 2      | D200 ... D299 |
| 7      | D700 ... D799 |

### The spindle as a tool carrier

| Tool carrier | D-numbers     |
|--------------|---------------|
| 8            | D800 ... D899 |

## Maximum permissible tool length in radial direction

In the following are explained the permissible tool lengths depending on the presence or non-presence of the Y-axis.

***Danger of a collision!***

***An exceeding of the permissible tool lengths can result in a damage to the machine at turret indexing.***

### Machine without Y-axis

The max permissible tool length is 130 mm.

***This applies to all tool carriers (turret 1, 2 and 7).***

P1201.10021\_22

## Machine with Y-axis

For the position **Y0** the max tool length is **130 mm**.

For the position **Y30** the max tool length is **100 mm**.

*This applies to all tool carriers (turret 1, 2 and 7).*

**Danger of a collision!**

**When using the Y-axis for the production of a workpiece a maximum tool length of 100 mm should not be exceeded.**

Y-axis position = Y- 30

Y-axis position = Y0

P1201.10021\_21

## Maximum permissible tool length in axial direction

On turret 1 axial tools can be also mounted inversely (pointing back)  
The maximum axial tool length is **120 mm** in this case.

P1201.10021\_24

*On the turrets 2 and 7 use of inverse axial tools does not really make sense.*

## Turret equipment

According to operations to be performed, like e.g. polygon turning with the counter spindle, the equipping of the turret is restricted.

### Polygon turning with the counter spindle

**Turret 1:** - no restriction

**Turret 2:** - Up to 44 mm across the flats the turret station in the working position must be kept vacant.

- Over 44 mm across the flats the turret station in the working position must be kept vacant. Additionally for the neighboring station a collision check must be carried out.

**Turret 7:** - Up to 44 mm across the flats the turret station in the working position and the neighboring station must be kept vacant. Additionally for both neighboring stations a collision check must be carried out.

- Over 44 mm across the flats the turret station in the working position, the neighboring station and two further neighboring stations must be kept vacant.

P1201.10021\_23

## Further hints

The maximum possible width across the flats depends on the following factors:

- The OD of the milling hob
- The clamping means used in the counter spindle
- The current position of the Z5-axis in relation to the machine zero point "M"

The max possible width across the flats that can be produced is calculated as follows:

$$2 \cdot 93 - \text{outside diameter of the hob}$$

**The value 93 mm at polygon turning results from the max. counter spindle travel (in X- and Z-direction).**

**At normal machining the max. travel of the counter spindle is 150 mm.**

## Example

The hob has an OD of 150 mm

$$2 \cdot 93 - 150 = \mathbf{36 \text{ mm}}$$
 (max. width across the flats INDEX C65)

P1201.10021\_28

**Danger of collision!**

**Fundamentally danger of a collision exists between the counter spindle and tool carrier 2 (refer to the illustrated example above).**

## Workpiece taking over by the counter spindle

**Turret 1:** - The cutting-off operation must be performed by turret 1.

**Turret 2:** - The maximum tool length in radial direction in the working position = **110 mm** when a chuck with 126 mm diameter is used.

P1201.10021\_25

***Danger of a collision!***

***The turret 2 must stand in the furthest possible left hand side position!***

**Turret 7:** - The max. radial tool length in working position = **115 mm** when a chuck with 126 mm diameter is used.  
- the max. length of the neighboring tool = **105 mm**.

P1201.10021\_25

## Chucks

### Chuck < Dia 140

There are no restrictions for these chucks, i.e.:

- Standard tool holders can be used.
- Axial drilling tools can be mounted in stations next to each other.
- The turret 1 can work with axial tools in both directions (main- /counter spindle).

### Chuck Dia 140 - 200

For these chuck there are restrictions in reference to the above mentioned points. In each individual case a collision check must be carried out.

### Chuck Dia 200 – 350

For these chuck there are severe restrictions. They are suitable only for machines with special tool holders (special purpose machines).

***Regarding the max. swing diameter chuck up to 350 mm diameter can be mounted.***

## Bar work

The inside diameter of the chucking tube is:

- With the machine G42 -> 44 mm diameter
- With the machine G65 -> 67 mm diameter

The following guide tube liners are available:

- With the machine G42 -> max up to bar Dia 43 mm
- With the machine G65 -> max up to bar Dia 66 mm

P1201.10021\_1

1) Optionally is available a drive of its own for turret 7 (for turret indexing and for the tool drive, respectively). This drive is designated as "S7".

## Machine with a Y-axis

The total travel in Y-direction is 70 mm

Y1 -> +40/-30

Y2 -> +30/-40

## Machine without a Y-axis

P1201.10021\_18

## Selecting Turret 2 or 7

The tool carrier 2 is equipped with a double turret,. Each of these turrets has a zero point of its own ->T<sub>2</sub> and T<sub>7</sub>

For the selection of the desired turret serves the cycle L200.

**Cycle call: L200 (x)**

└─── Number of the turret -> 2 or 7

With the cycle call for turret 7 the tool carrier reference point is shifted in X-, Y- and Z-directions from the reference point "T<sub>2</sub>"(turret 2) to the reference point "T<sub>7</sub>" with the aid of the basis point zero offset 'rough'.

**Basic position is the reference point "T<sub>2</sub>" (turret 2).**

By using the cycle L200 the input of the position of turret 7 as adapter dimension is omitted.

The cycle must be programmed only at turret change before calling the T-command. With several machining operations with the same turret the offset will be maintained, in the cycle L100 (basic position) the turret 2 is automatically called..

With the selection of the particular turret this will be selected in the selected in the tools management as well.

|          |          |
|----------|----------|
| L200 (2) | turret 2 |
| L200 (7) | turret 7 |

***Danger of a collision!***

***At traveling with G53 all zero offsets will be suppressed block by block. Then the programmed positions refer to the machine zero point "M" and the turret reference point "T<sub>2</sub>".***

## Turret 7

The distance of the tools reference points of turret 2 ( $T_2$ ) to turret 7 ( $T_7$ ) is input in the following cycles machine data:

| Turret | X-axis    | Y-axis    | Z-axis    |
|--------|-----------|-----------|-----------|
| 7      | I_ZMD[33] | I_ZMD[34] | I_ZMD[35] |

- *The input of the data is done in the metric system.*
- *By calling the cycle L200 the data is loaded into the 1<sup>st</sup> basic zero point offset 'rough'.*

## Counter spindle

The counter spindle zero point can be corrected with the aid of the following cycle machine data.

| Channel | X-axis     | Y-axis     | Z-axis     |
|---------|------------|------------|------------|
| 1       | I_ZMD[81]  | I_ZMD[82]  | I_ZMD[83]  |
| 2       | I_ZMD[111] | I_ZMD[112] | I_ZMD[113] |

- *The input of the data is done in the metric system.*
- *By calling the cycles L130 or L225 the data is loaded into the 2<sup>nd</sup> basic zero point offset 'rough'.*
